

MDR

[SEC]

Extend the protection of your organization's corporate endpoints and environment quickly, effectively and at predictable low cost

Main benefits

Secure device and corporate environment, fast deployment, low cost

The Managed Detection Response (MDR) is the service that allows the company to monitor the activities performed in the corporate environment and on the devices in real time, thereby improving security standards. Through the installation of agents on the devices, it is possible to identify threats at an early stage and automate remediation actions in a timely manner.

Scope

The service is aimed at all small and medium-sized companies that need to monitor the corporate environment with a low commitment of resources.

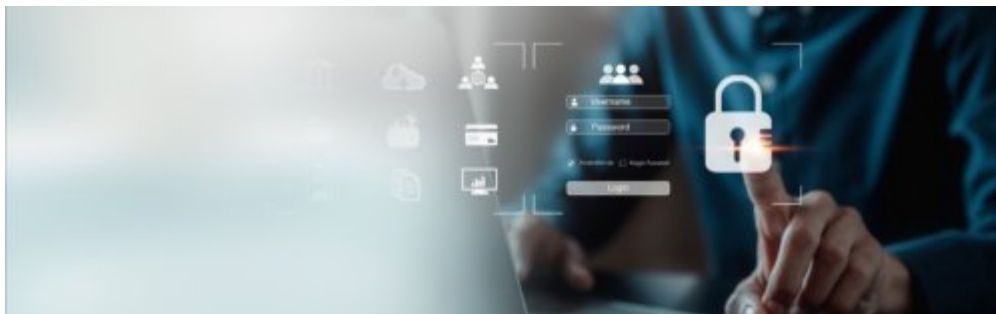

The service does not require specific cybersecurity knowledge within the client company, which is often difficult and costly to manage in-house.

Challenges facing companies

Small and medium-sized companies often lack the necessary resources and skills to manage and control security adequately. They are constantly, and often unknowingly, exposed to numerous cyber risks and threats that can be solved even with limited resources. Uncertainty and risk are amplified by the lack of specialized cybersecurity personnel who can provide valuable support and advice.

The advantages offered

The company's management gains awareness of the risks to which the company is exposed, and mitigates their potentially significant impacts on business continuity at a reduced cost. The company's IT staff, when present, acquires specialized and competent support, and avoids making business security decisions and initiatives of questionable effectiveness.

S2E: approach and proposed methodology

S2E's service combines outstanding expertise with consultancy standing in cybersecurity, often exclusive to large companies, with an easy-to-implement technology product that guarantees immediate and effective results in preserving corporate security, at a low cost.

We take care of installing the EDR and XDR agents on the company's infrastructure to monitor its activities and immediately detect any threats or attempts at fraudulent activity, backed up by a 24/7 expert staff intervention service. In this way, the company gains confidence in its online presence, without committing large resources or undertaking complex and time-consuming projects. The service is provided at a cost adapted to the size of the number of devices and networks to be monitored and protected, at an easily predictable cost.

Future development benefits

The main advantages of the MDR service are:

1. Very short implementation time, increasing corporate security quickly.
2. 24/7 support from experienced personnel when detecting threats and suspicious activity, with timely intervention.
3. Low and easily predictable costs, proportional to the number of devices and networks to be monitored and protected.
4. Automation of remediation activities for key threats and risks that can compromise the security of the organisation.

Offer model

Our MDR service is provided in the form of a managed service, with variable costs depending on the size of the perimeter to be monitored and protected. The cost of the service is calculated on a pay-per-device basis and includes consultancy and intervention by qualified and experienced personnel with clear and contractually defined SLAs, 24/7.
