

CISOaaS

[SAC]

Rely on consultancy support for the adoption of cybersecurity best practices

Main benefits

Enterprise-wide risk analysis, awareness, and mitigation

CISOaaS is S2E's response to the market's growing need to address cybersecurity in a structured and knowledgeable manner, employing know-how of excellence capable of identifying, assessing and addressing critical risks to business continuity in compliance with legislation. In a context where data is the new oil, safeguarding corporate information assets plays an important role in the evolution of corporate strategy.

Scope

Cybersecurity is an issue that affects all organisations. The evolution of corporate complexity, with blurred organisational boundaries blurred, in scenarios characterised by increasing technological and information intensity requires appropriate strategic direction at managerial level, making the safeguarding of corporate security a complex task. Regulatory developments and unstable geopolitical contexts represent additional complexity, making cybersecurity a issue of collaboration and awareness of the entire organisation.

Challenges facing companies

The hectic evolution of the market and the contexts that revolve around it bring security challenges whose variety makes their mitigation difficult. Companies find it difficult to acquire, maintain and evolve the know-how required to meet modern security challenges. Investments in cybersecurity are difficult to justify to shareholders as their effectiveness only manifests itself when the organisation is not affected by adverse events. The modern company therefore needs professionals who can generate awareness in management.

The advantages offered

Corporate management can address and mitigate risks that may threaten business continuity, as well as the reputation of the organisation itself. The ICT function gains strategic and operational support to address issues that require different know-how. The entire organisation benefits from a structured and comprehensive approach to identifying and addressing ICT risk, as well as spreading cyber security awareness throughout the entire company.

S2E: approach and proposed methodology

Through the CISOaaS service, S2E acts as an authoritative partner to bridge the cybersecurity knowhow gap of the client company, supporting its management in identifying and mitigating risks through a structured plan that envisages the implementation of international processes and best practices according to specific business needs. We support our clients in adapting to organisational, technological, and regulatory changes with a cross-functional approach; through an understanding of the client's business we propose an incremental, structured and flexible path aimed at the collaboration of corporate functions to generate awareness of risks and best practices in cybersecurity. We provide ongoing management consulting to accompany our clients through modern challenges, providing the necessary skills to achieve the goal: safeguarding corporate assets.

Future development benefits

The main advantages of CISOaaS are:

1. Acquisition of strategic know-how to safeguard the company's assets.
2. Saving time and recruiting costs for complex and highly specialised figures.
3. Security plans adapted to the specificities of your company.
4. Preservation of business continuity and reputation.
5. Flexibility in service commitment and delivery to consolidate a lean cost structure.
6. Implementation of monitoring to enable measurable ROI of the initiative.

The importance of a flexible service with consultative standing, capable of supporting the company in the evolution of its business in a safe, considered, and compliant manner allows for stable and informed decision-making.

Offer model

CISOaaS is proposed on the basis of the client's specific needs. We analyse and consider the characteristics of your organisation, and based on this we propose three different levels of service adoption, so as to increase the coverage and involvement of our experts as the complexity and size of your organisation and business increases. Each bundle includes an initial comprehensive analysis of your organisation and its specificities, the definition of a roadmap with prioritisation of interventions to mitigate the critical issues encountered, and guidance and/or operational support for priority interventions. We foresee the presence of our experts in your company for a few days to understand your specificities and establish a climate of trust necessary for highly critical activities.

Meet the team: our expertise

The offer is delivered by personnel experienced in information security in the company, holding the most relevant certifications in the field. Our team is represented within the European CISO community, being an active member.

We are experts in the use of the main reference frameworks in cybersecurity and regulatory compliance, such as ISO/IEC27001, NIST CSF and CIS Critical Security Controls.

Our work focuses on the demonstrability of the impacts of information security investments in the company, the results of which can often be perceived as not very tangible or measurable. To do this, we adopt a methodology designed to ensure the observability of the company's progress within the maturity model, with the objective of assessing the progress and quality of its information security investments. These assessments, supported by demonstrable data, can be submitted to and used by company management for the strategic evaluation of its security posture.
